

Altosid is used in Land O Lakes Purina Feeds products for feed through fly control for beef cattle. It is available in cooked tubs, weatherized minerals, and meal minerals to fit a variety of situations. This is a great product, and it produces amazing results.

The feed-through benefits.

Less Stress on Your Herd

Since Altosid IGR Feed-Thru is administered in your herd's feed or mineral, cattle don't need to be touched to be treated, as they do with sprays, pour-ons, dusts and ear tags.

More Effective Than Insecticides

Rubbing stations and dust bags must be frequently serviced to ensure that the insecticide is present and that they are working properly. Dusts and sprays remain effective only with periodic retreatment. Since ear tags use a single chemical family, pyrethroids, horn flies have become resistant to this method of control.

More Convenient, Too

When your herd takes its feed or mineral, it's being treated with Altosid IGR Feed-Thru. No stress-inducing applications for your herd - and no time-consuming extra steps for you.

More Control for Less Cost

With Altosid IGR Feed-Thru, you can control horn flies for as little as three to five cents per head per day. To learn how much value this innovative feed-through can provide to your operation, [start here](#).
